Complex Computing Problem (CCP):

Planning trips and connecting with compatible travel partners in Pakistan is currently fragmented and unreliable. People rely on scattered WhatsApp groups, Instagram pages, and informal community networks, which creates several issues:

No centralized platform for organizing trips, coordinating groups, or finding travel companions.

Low safety and trust, since users interact with unverified people and lack transparency about who they are traveling with.

Poor coordination, as trip plans, expenses, and communication are spread across multiple apps and chats, often leading to confusion or mismanagement.

This lack of structure makes travel planning inefficient, risky, and inaccessible for many users.

Proposed Solution:

Mera Musafir is an AI-powered travel platform designed to centralize and streamline the entire trip-planning experience. The app helps users create trips, find compatible travel partners, and stay secure through verified profiles and smart safety features. It brings together itinerary planning, group coordination, expense oversight, and traveler matching into a single integrated space.

By addressing the core issues of fragmentation, trust, and organization, Mera Musafir offers a unified, safe, and intelligent travel experience for users across Pakistan.
